Normal Approximation to Binomial Distribution

Central Limit Theorem

Let random variable W have mean μ_w and standard deviation σ_w . Let random variable X represent the **sum** of n instances of W.

$$X = W_1 + W_2 + W_3 + \cdots + W_n$$

Then:

$$\mu_{\mathsf{X}} = \mathsf{n}\mu_{\mathsf{W}}$$
$$\sigma_{\mathsf{X}} = \sqrt{\mathsf{n}}\sigma_{\mathsf{W}}$$

and X is approximately normal.

$$X \sim \mathcal{N}(\mu_{\mathsf{X}}, \, \sigma_{\mathsf{X}})$$

Bernoulli (review)

Let W be a Bernoulli random variable.

$$\begin{array}{c|c}
\hline
w & P(w) \\
\hline
0 & q \\
1 & p
\end{array}$$

$$\mu_{w} = p$$

$$\sigma_{w} = \sqrt{pq}$$

Binomial distribution is a case of Central Limit Theorem

Let W be a Bernoulli random variable.

$$\frac{\overline{w \quad P(w)}}{0 \quad q} \\
1 \quad \rho$$

$$\mu_{w} = p$$

$$\sigma_{w} = \sqrt{pq}$$

Let X represent the **sum** of n instances of W.

$$\mu_{\scriptscriptstyle X} = n p$$
 $\sigma_{\scriptscriptstyle X} = \sqrt{n} \sqrt{p q} = \sqrt{n p q}$

X is approximately normal.

Example

Let W be a Bernoulli random variable with 80% chance of success.

$$\begin{array}{c|cc}
\hline
w & P(w) \\
\hline
0 & 0.2 \\
1 & 0.8 \\
\end{array}$$

$$\mu_w = 0.8$$

$$\sigma_w = \sqrt{(0.8)(0.2)} = 0.4$$

Let X represent 100 repetitions of W.

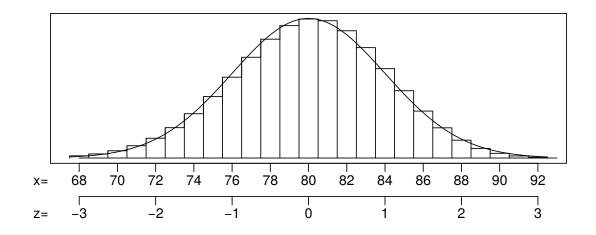

$$X = W_1 + W_2 + W_3 + \cdots + W_{100}$$

Thus,

$$\mu_{\rm x} = (100)(0.8) = 80$$

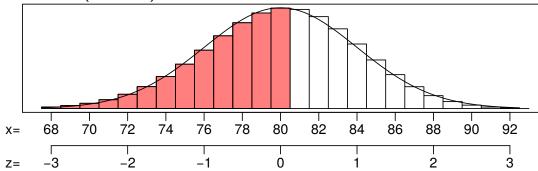

$$\sigma_{x} = (\sqrt{100})(0.4) = 4$$

Binomial and Normal Approx with p = 0.8 and n = 100.

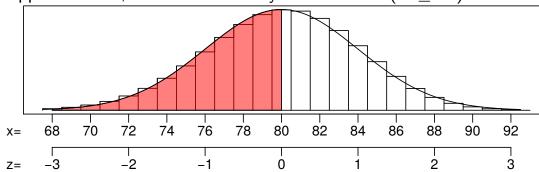

Actual vs Approx... $P(X \le 80)$

Actual: $P(X \le 80) = 0.5398386$

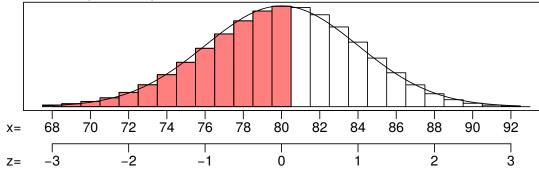

Approximation, without continuity correction: $P(X \le 80) \approx 0.5$

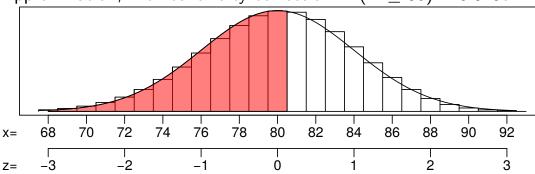

Actual vs Approx with continuity correction... $P(X \le 80)$

Actual: $P(X \le 80) = 0.5398386$

Approximation, with continuity correction: $P(X \le 80) \approx 0.5497$

When to use normal approximation to Binomial Distribution

- ▶ When *n* is large.
- ▶ When p is not near 0 or 1.
- ▶ If both $np \ge 10$ and $nq \ge 10$ then normal approximation to binomial distribution is cool.

Bad approximation... n = 7 and p = 0.2
